

## The q -state Potts Model: Partition functions and their zeros in the complex temperature- and q-plane

Filesize: 4.71 MB

### ***Reviews***

*The ebook is not difficult to read through easier to comprehend. Of course, it is perform, nonetheless an interesting and amazing literature. Once you begin to read the book, it is extremely difficult to leave it before concluding.*

## THE Q -STATE POTTS MODEL: PARTITION FUNCTIONS AND THEIR ZEROS IN THE COMPLEX TEMPERATURE- AND Q-PLANE

To read **The q -state Potts Model: Partition functions and their zeros in the complex temperature- and q-plane** PDF, please click the button listed below and save the ebook or gain access to additional information that are related to **THE Q -STATE POTTS MODEL: PARTITION FUNCTIONS AND THEIR ZEROS IN THE COMPLEX TEMPERATURE- AND Q-PLANE** ebook.

GRIN Verlag Mrz 2014, 2014. Taschenbuch. Book Condition: Neu. 210x148x9 mm. This item is printed on demand - Print on Demand Neuware - Master's Thesis from the year 1999 in the subject Physics - Theoretical Physics, grade: 1,0, State University of New York at Stony Brook (Institute for Theoretical Physics), course: -, language: English, abstract: In this thesis results on the Partition function  $ZG(T, q)$  for the q state Potts Model on finite polygonal lattices G are presented. These are polynomials in  $a$  and  $q$ . The first step is to calculate all the coefficients of  $ZG(a, q)$  using a transfer matrix method. The only points of non analyticity are the zeros of the partition function; in the thermodynamic limit the complex temperature zeros form a continuous curve B via coalescence. This is the locus where the free energy is non analytic. The zeros of  $Z(a, q)$  in the complex q plane for finite a and in the complex a plane for integer and non integer values of q are plotted. For  $a = 0$  the partition function reduces to the chromatic polynomial  $PG(q)$  of the graph and the zeros are called chromatic zeros. The behavior of those zeros as a increases from zero is investigated. As for complex temperature the zeros in q form a continuous curve in the thermodynamic limit. This is the locus where the limiting function  $WG(q) = \lim_{n \rightarrow \infty} PG(q)^{1/n}$  is non analytic.  $WG(q)$  is the ground state degeneracy and is connected to the ground state entropy via  $S_0(G, q) = k_B \ln(WG(q))$ . Thus the characteristics of the zeros of q and a for finite lattices help to understand the properties of the model in the thermodynamic limit. 128 pp. Englisch.
