Excerpt: . introduction So Important a part do diffusion and osmotic pressure seem to play in the vital processes of plants, that it is wellnigh impossible to consider any phase of vegetable physiology without some reference to these subjects. It is obviously not to the point, however, to attempt here a discussion of every phenomenon in plant life into which they enter. Rather will attention be directed to certain groups of phenomena wherein diffusion and osmotic pressure seem to be fundamental factors. Thus, it is hoped, may be formed a general conception of the trend which modern study is taking along these lines. Of the four following chapters, the first three have to do with osmotic pressure as an internal factor in the life of the plant; in them are considered the most important effects of the development of diffusion tensions within the plant body. In the last chapter are brought together the responses of the organism to variations in the osmotic pressure of the surrounding medium. Such division of the subject is merely expedient; it is purely artificial, for the organism and its surrounding medium are physically almost as truly continuous as are a mass of ice and the water in which it floats. Also--a fact which is often apparently lost sight of--every portion of the plant body is a portion of the environment of every other portion. This is of fundamental importance, especially in the physiology of multicellular forms. However, the plant body...
